ACTUAL SURVEY

data report

PREPARED BY DEPC TEAM (DATA QUALITY CONTROL)
STAT 143 SURVEY OPERATIONS

PLENARY SESSION #9
MAY 12, 2026

data cleaning overview

DATASET DIMENSION:

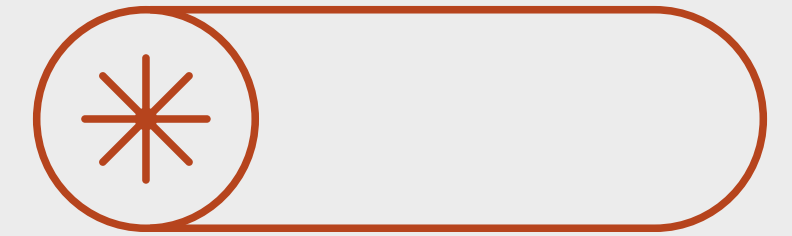

Raw: 679 x 256

Final: 629 x 193

The dataset originally had 679 rows and 256 columns. The following steps were taken:

1. Removed 5 submissions marked as invalid due to duplicates, malformed data, etc.
2. Removed metadata and instructional columns
3. Renamed variables for consistency
4. Recoded binary variables from 1/2 to 1/0
5. Fixed floating-point and formatting issues
6. Standardized verbatim responses
7. Removed ineligible respondents based on commute criteria
8. Addressed logical inconsistencies and outliers

data cleaning overview

VALIDATION AND CONSISTENCY CHECKS

Eligibility Check

- Removed respondents with fewer than 2 qualifying weekly trips ('Qualifying trip' is defined as any commute with a calculated roundtrip duration of at least 15 mins)

Logical Consistency Checks

- Checked for employment vs. age status
- Checked for inconsistent work status and commuting pattern
- Checked for mode of transportation vs. vehicle breakdown experience

Outlier Checks

- Corrected extreme values of age, commute duration and frequency, and number of dependents (Errors were validated with the enumerators before correction)

Coding/Kobo related issues

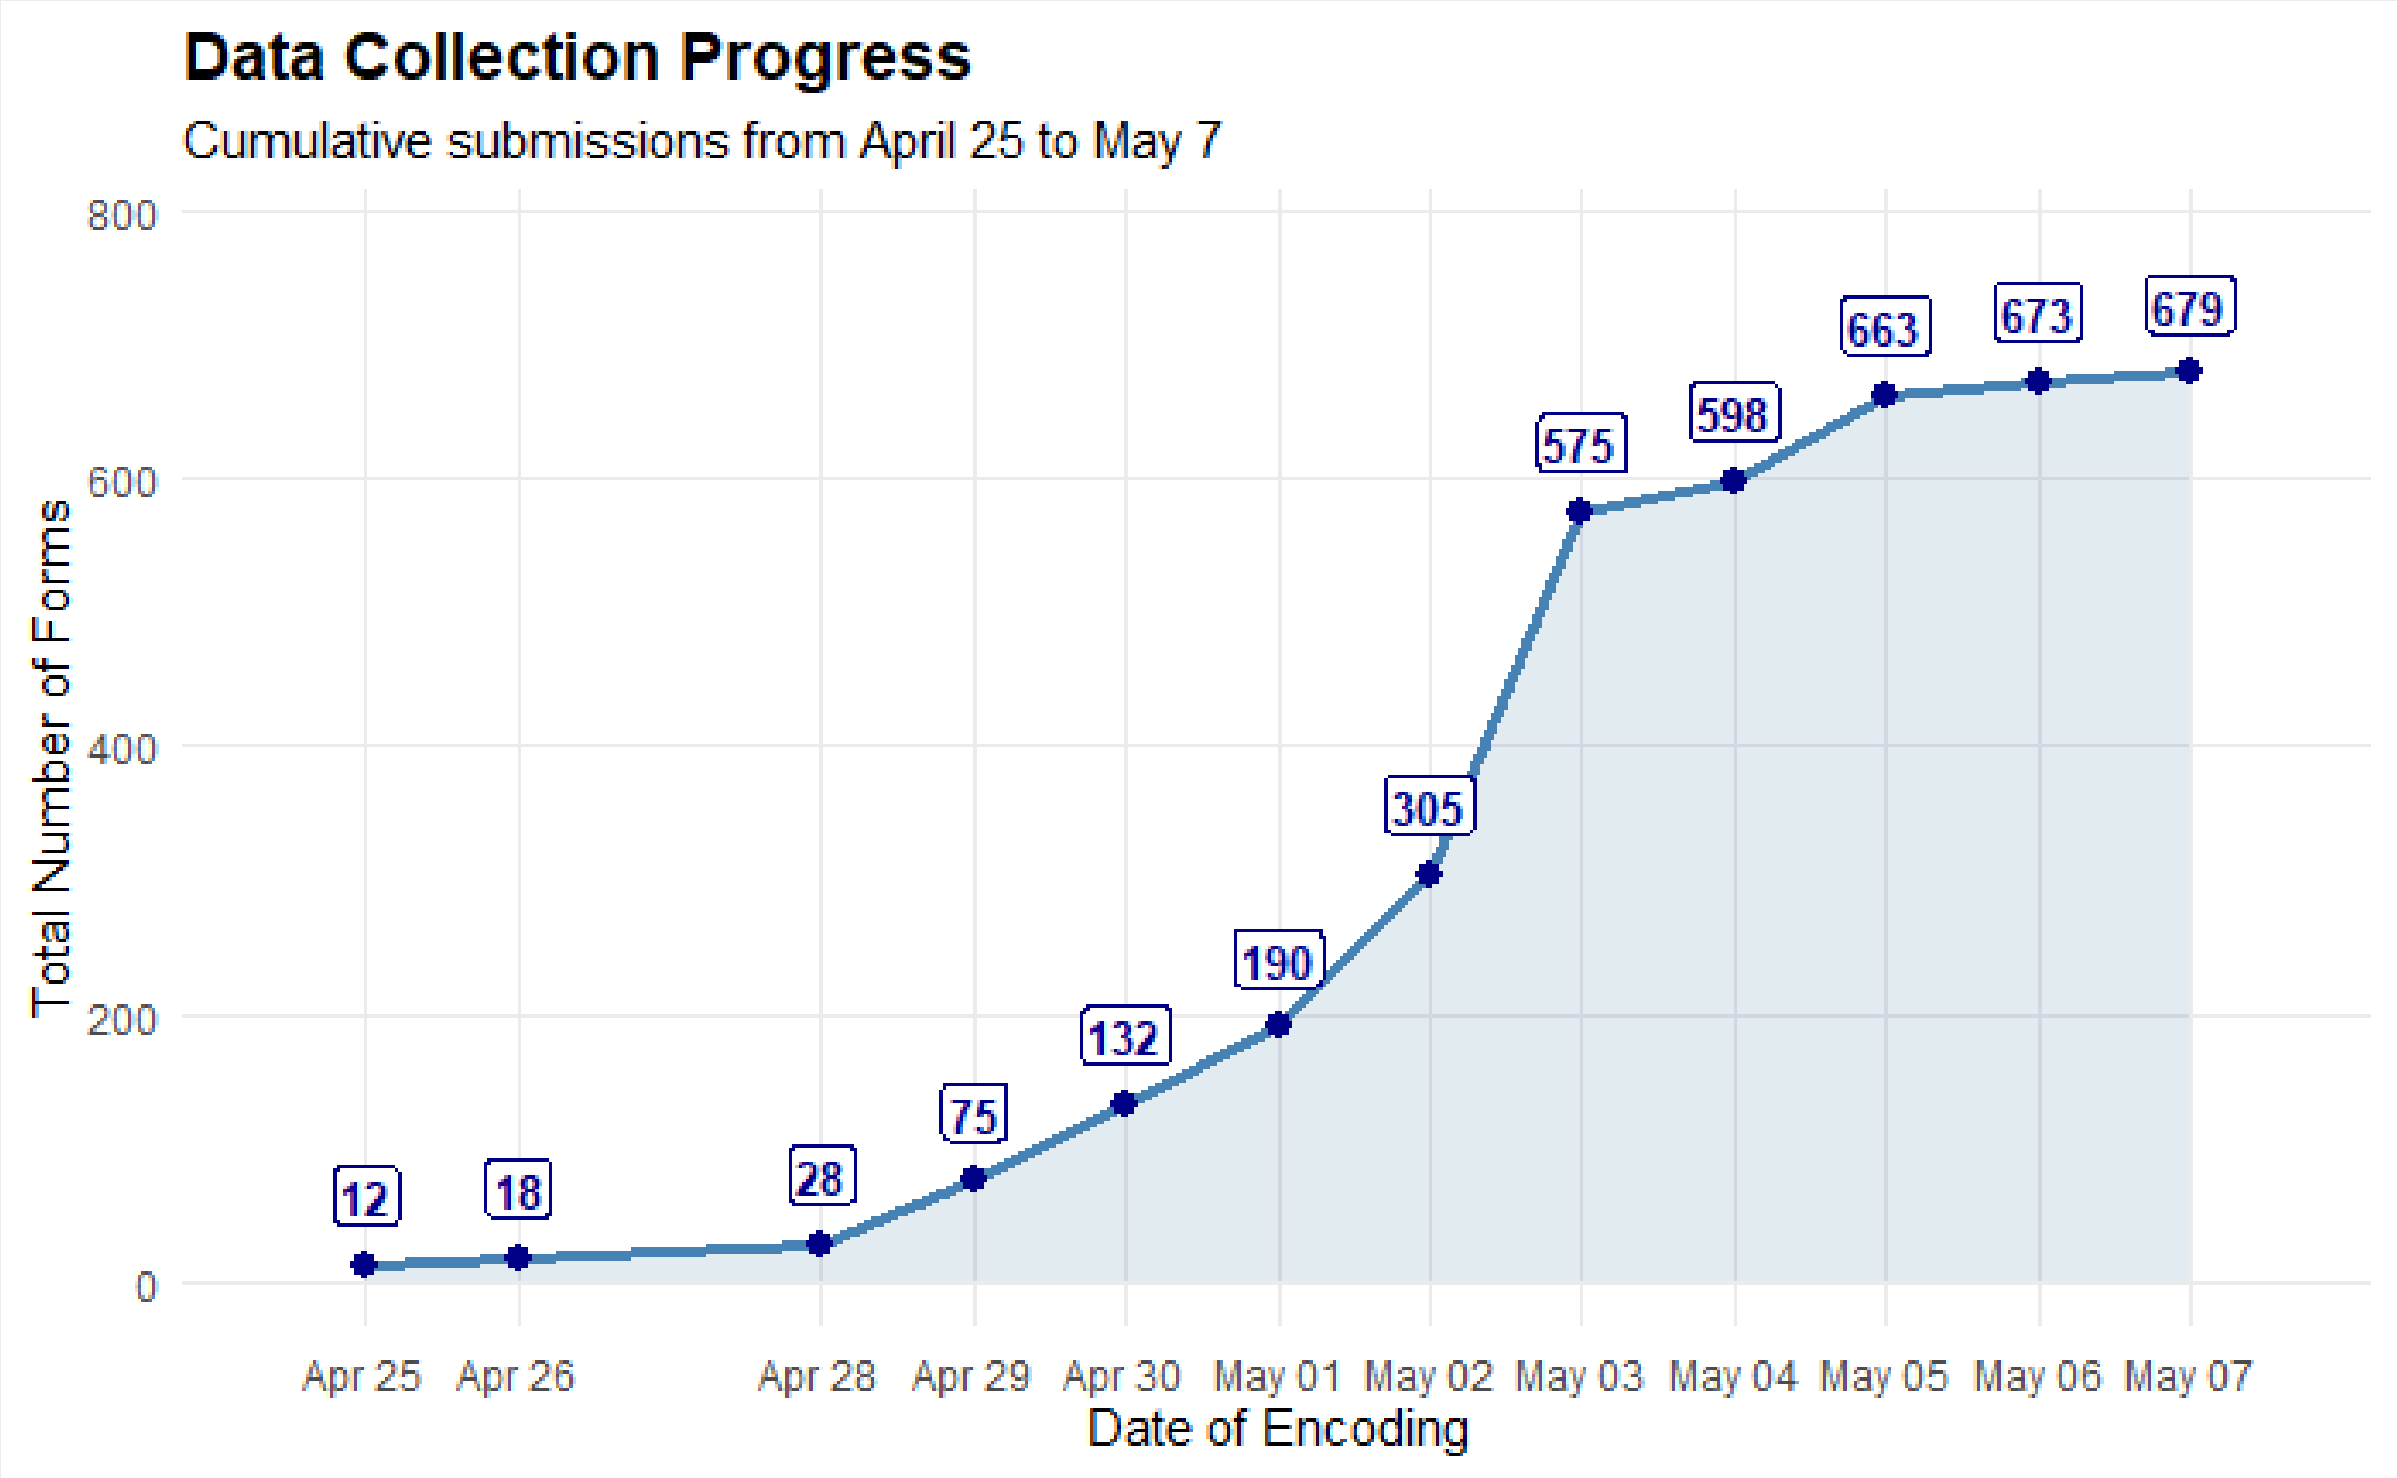

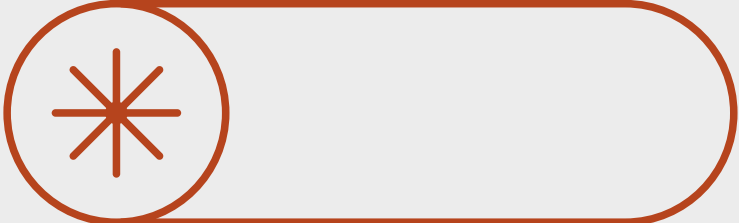

- Corrected N/A values resulting from missing enumerator response
- Recoded N/A values resulting from skip logic to "9999" to align with the codebook

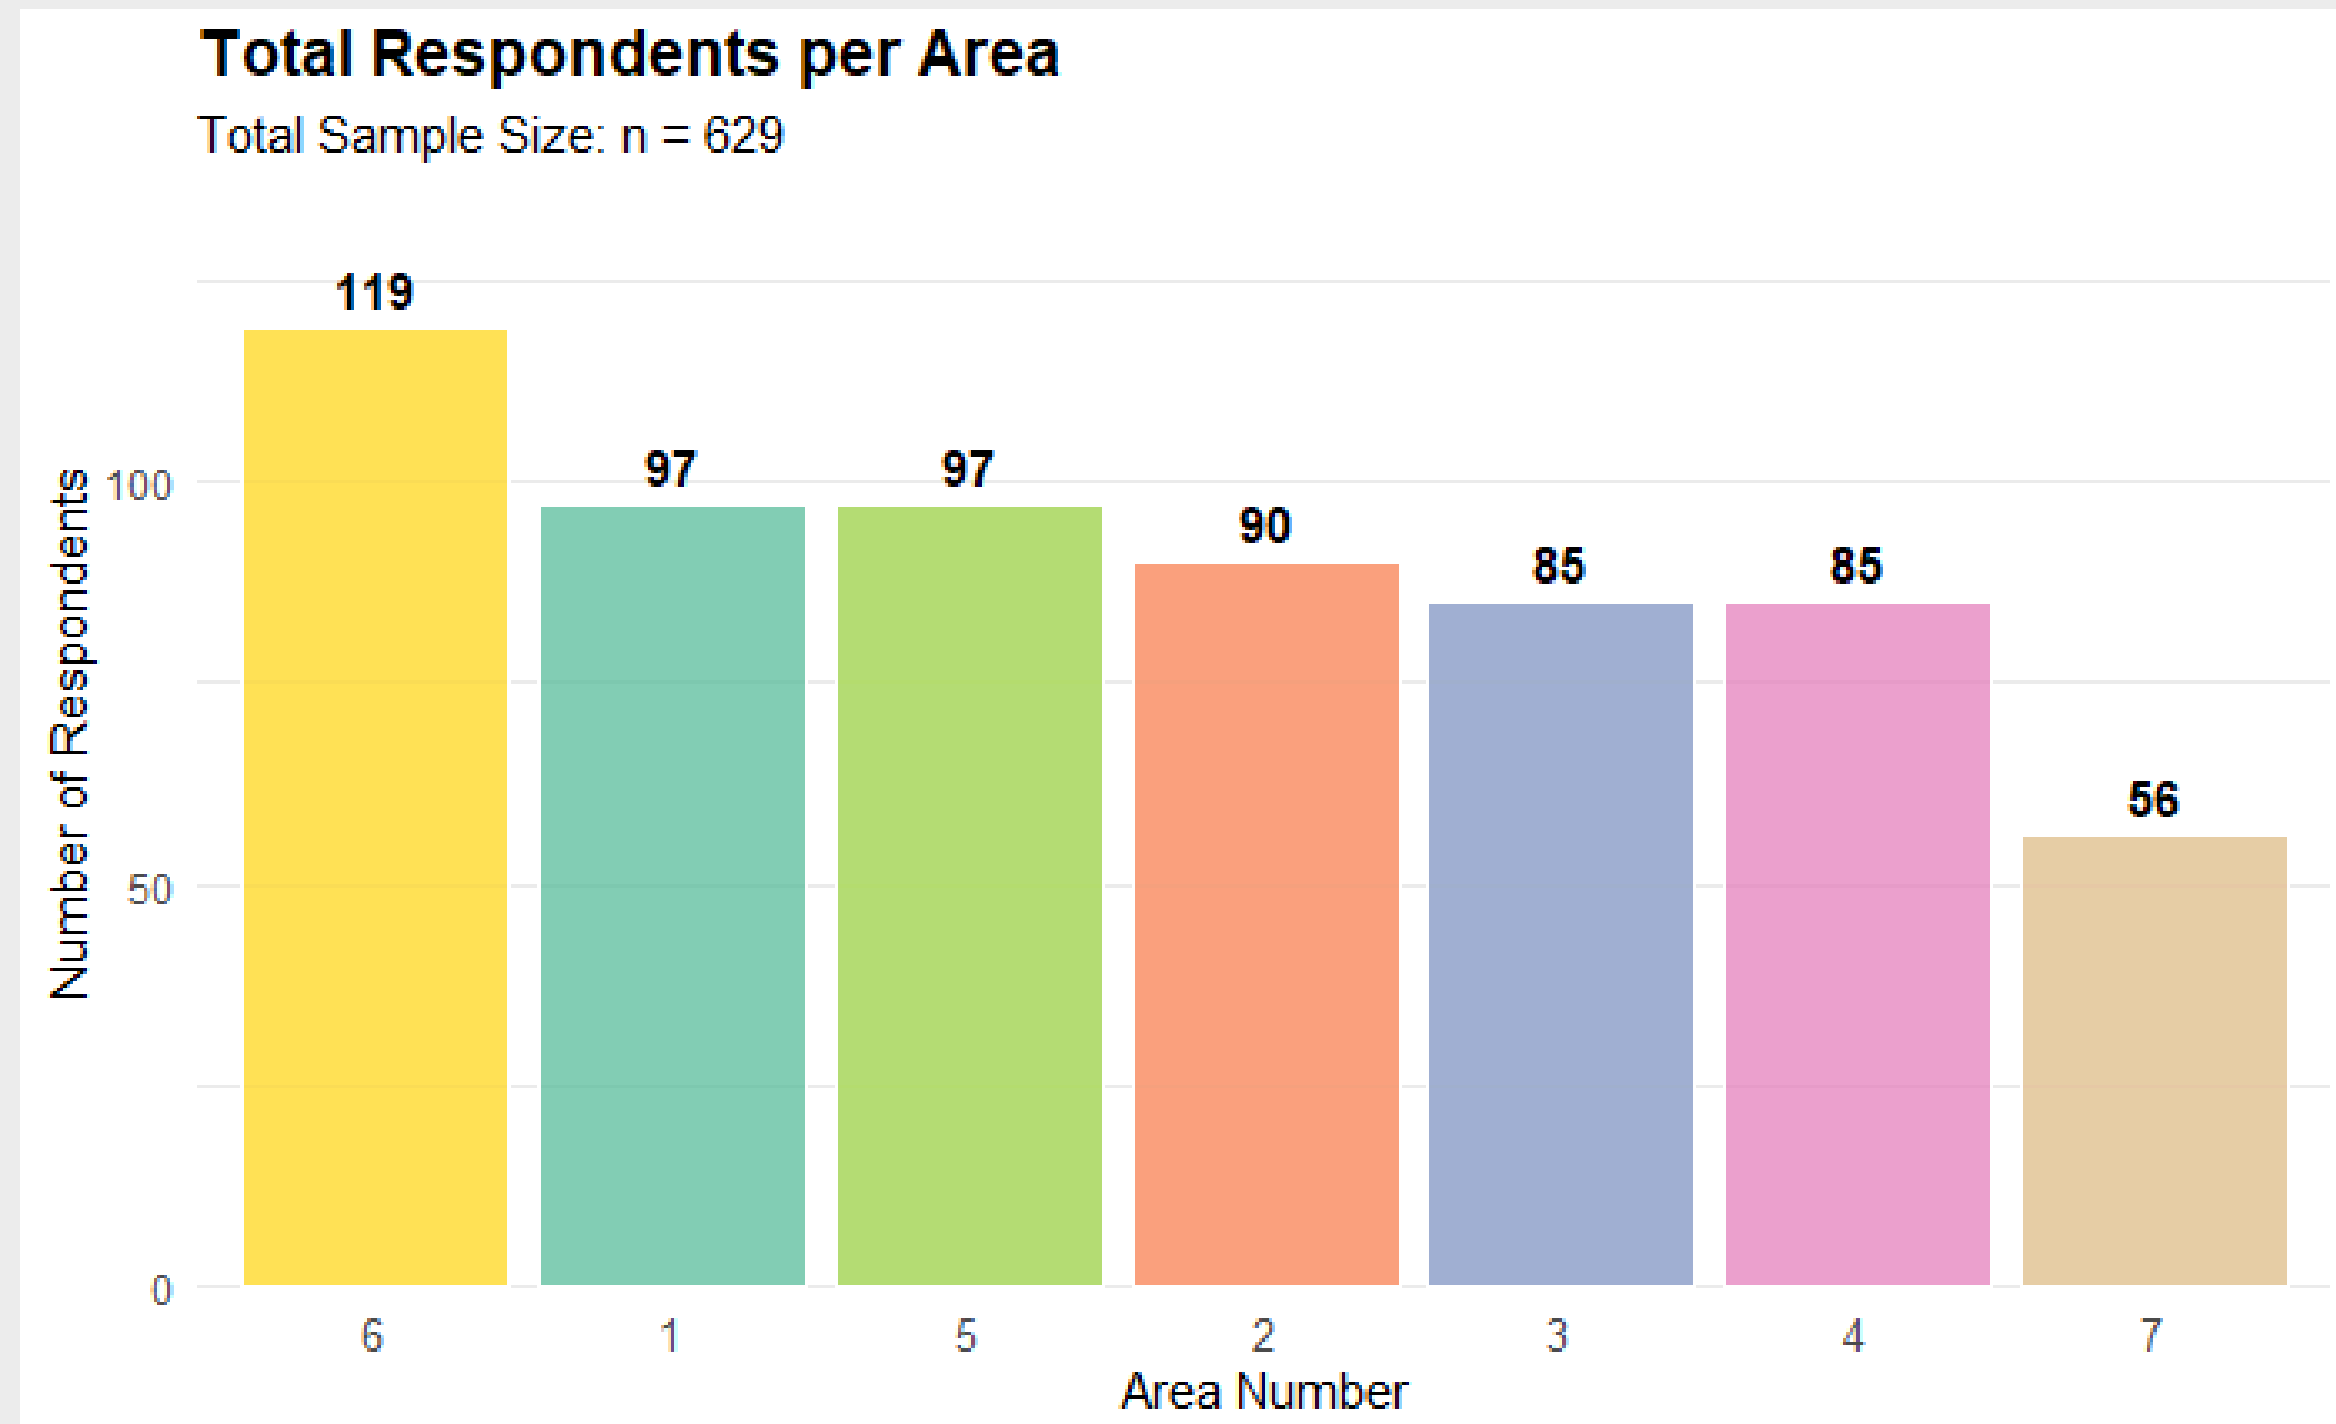

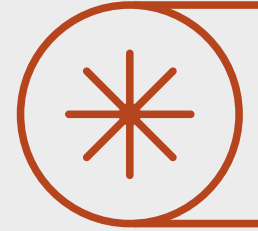

dataset features

- Questions that allow multiple responses are of "character" data type, so there are binary indicators variables (0 = not selected, 1 = selected) automatically created by Kobo
 - E.g. b1 has the ff. associated binary variables: b1_1, b1_2, ..., b1_5, where b1_1 is the indicator variable for being a full-time worker
- Likert-scale responses are numerically encoded
- Several questions have skip logic and conditional questioning
- Special codes "9999"/"143" were used to denote non-applicable/no responses
 - Be careful not to include them in numerical calculations (means, medians, etc.)
- Some questions have open-ended responses alongside pre-coded choices
 - Verbatim responses can have matching responses under the existing choices
- Transportation questions include frequency, duration, variability and flexibility

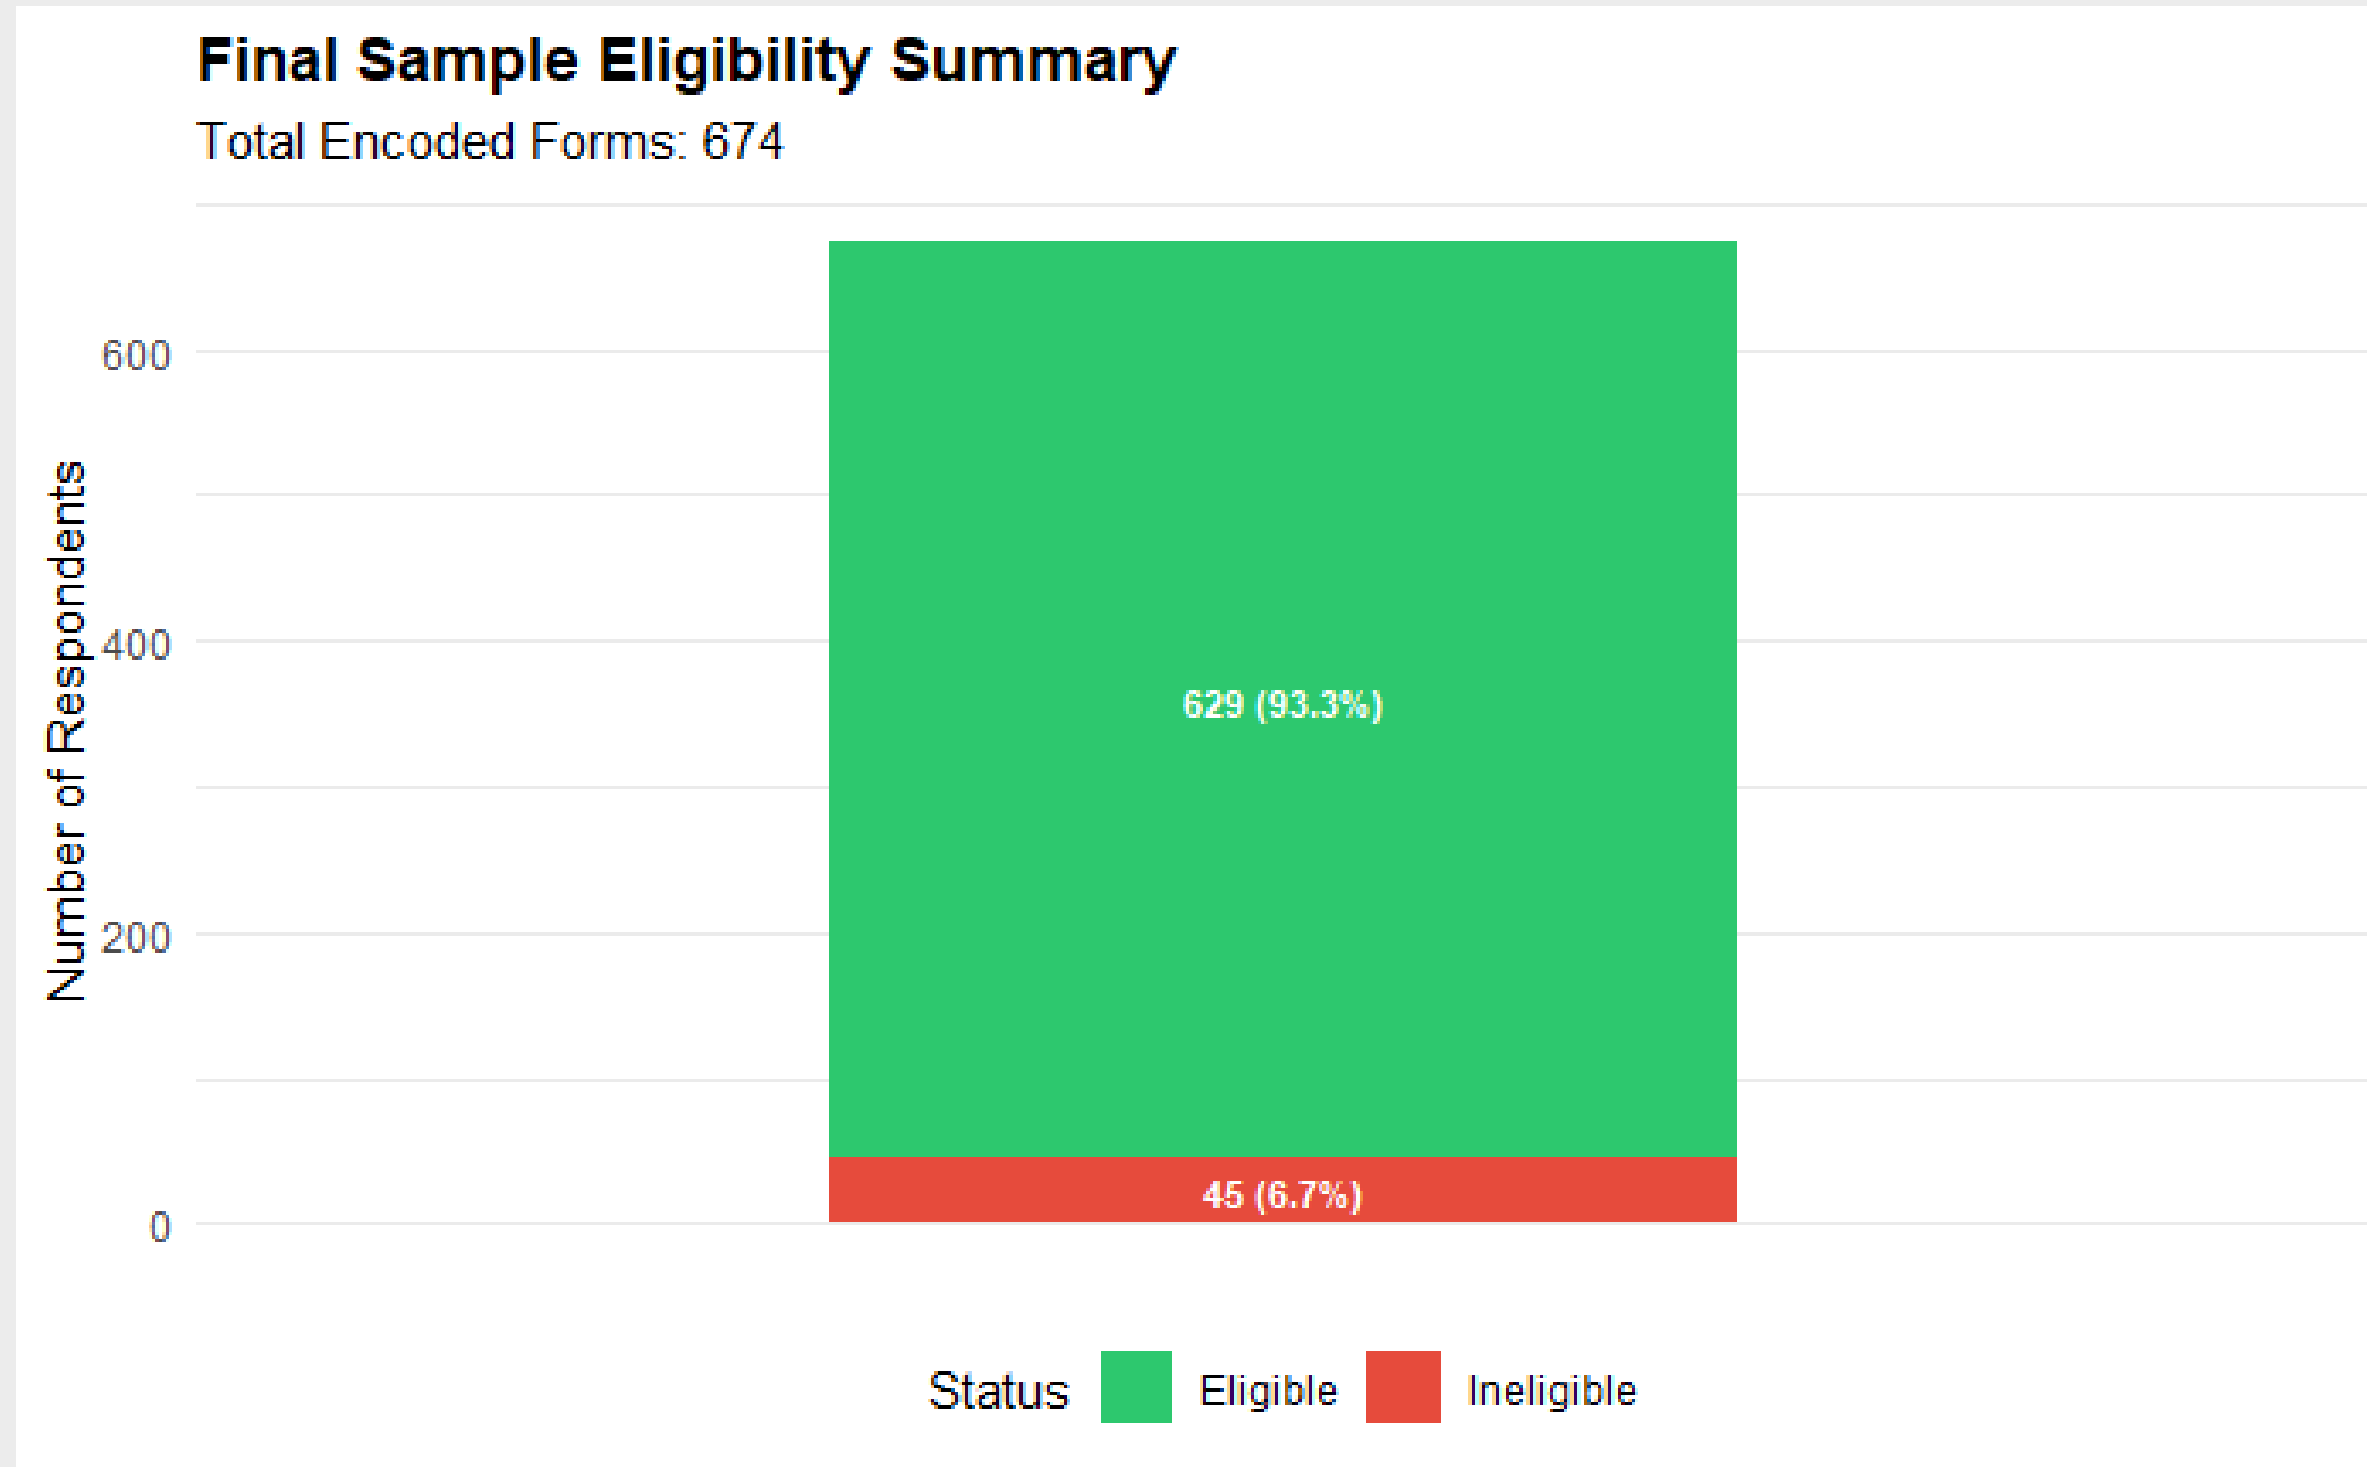

time series of submissions

no. of respondents per area

eligible vs ineligible respondents

other findings

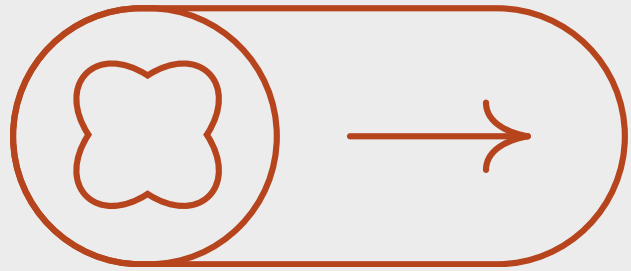

- **Discrepancy in the number of people commuting to work.**
 - A significant number of respondents who classify as F2F workers answered "N/A" in C3: Trabaho (number of times the respondent commutes to work in a week).
- **Discrepancy in the number of people commuting to school.**
 - The number of respondents reporting a frequency for commuting to school is **greater** than the number of respondents who classify as F2F students.
- Some respondents said that their **commute duration changes day-to-day but did not provide an explanation** (no selected codes, no verbatim)
 - There are some with codes selected, but no verbatim, and vice versa.

resolved concerns

- Out of the **10 respondents** that said their only mode of transportation is WALKING, **7** have an answer to the question about experiencing delays (C4.7) instead of "9999".
- Another respondent who answered "N/A" for delayed experience is reported to ride the jeep and trike.
- There are respondents that **only walk**, but have an answer to the question about "**nasiraan ng sasakyan**".
- There are respondents that said N/A to "nasiraan ng sinasakyan" but have other modes of transportation besides walking.
- There is N/A for questions the enumerator left blank because the question (C4.7) was not tagged as required in the Kobo form.

thank you
